College : Vignan's Nirula Institute of Technology and Science for Women

ASSIGNMENT 3- A simple RESTFUL API using React.js, DataBase Creation, and Creating Index

RestFul API code

The screenshot shows a Visual Studio Code editor with a project structure on the left. The file explorer shows a directory named 'api' containing 'route.js'. The main editor displays the content of 'route.js', which defines a POST endpoint. The code imports 'NextResponse' from 'next/server' and uses 'request.json()' to parse the incoming data. The response is a JSON object with a message. The bottom panel shows the 'TERMINAL' output, which includes compilation logs and the successful execution of the API endpoint, returning the expected JSON response.

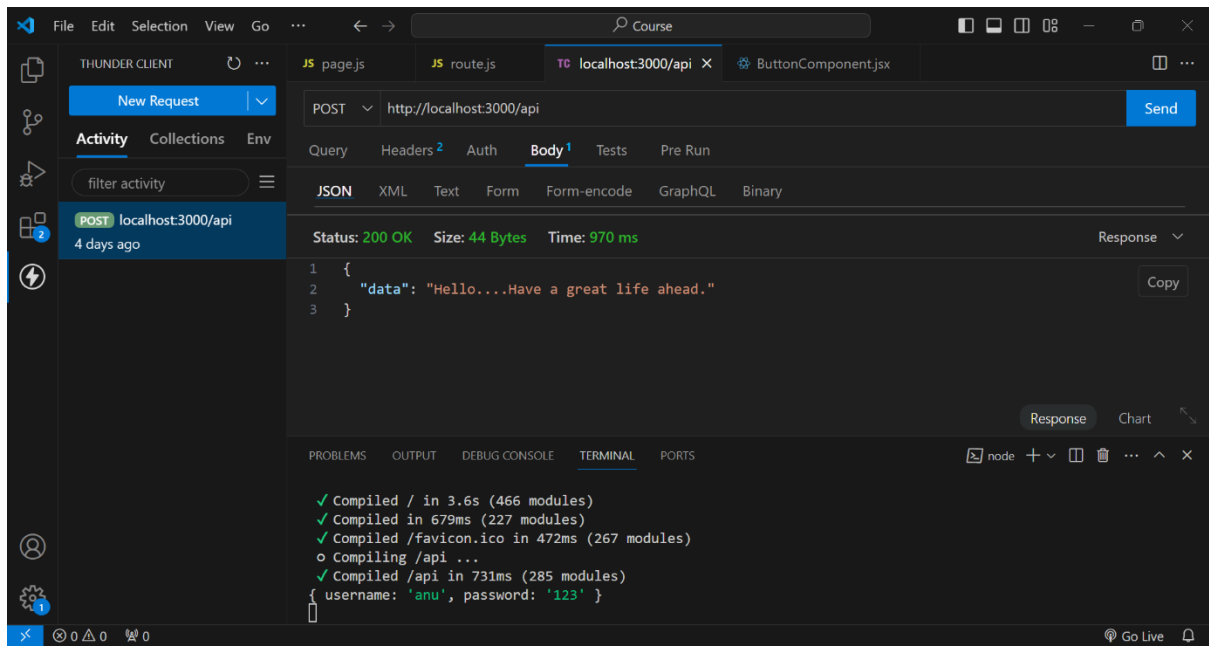

```
1 import { NextResponse } from "next/server";
2
3 export async function POST(request)
4 {
5   const data=await request.json()
6   console.log(data)
7   return NextResponse.json({
8     data: "Hello...Have a great life ahead."
9   })
10 }
11 }
```

TERMINAL

```
✓ Compiled / in 3.6s (466 modules)
✓ Compiled in 679ms (227 modules)
✓ Compiled /favicon.ico in 472ms (267 modules)
o Compiling /api ...
✓ Compiled /api in 731ms (285 modules)
{ username: 'anu', password: '123' }
```

Rest Output on ThunderClient

This is the output when we create an API using REST.

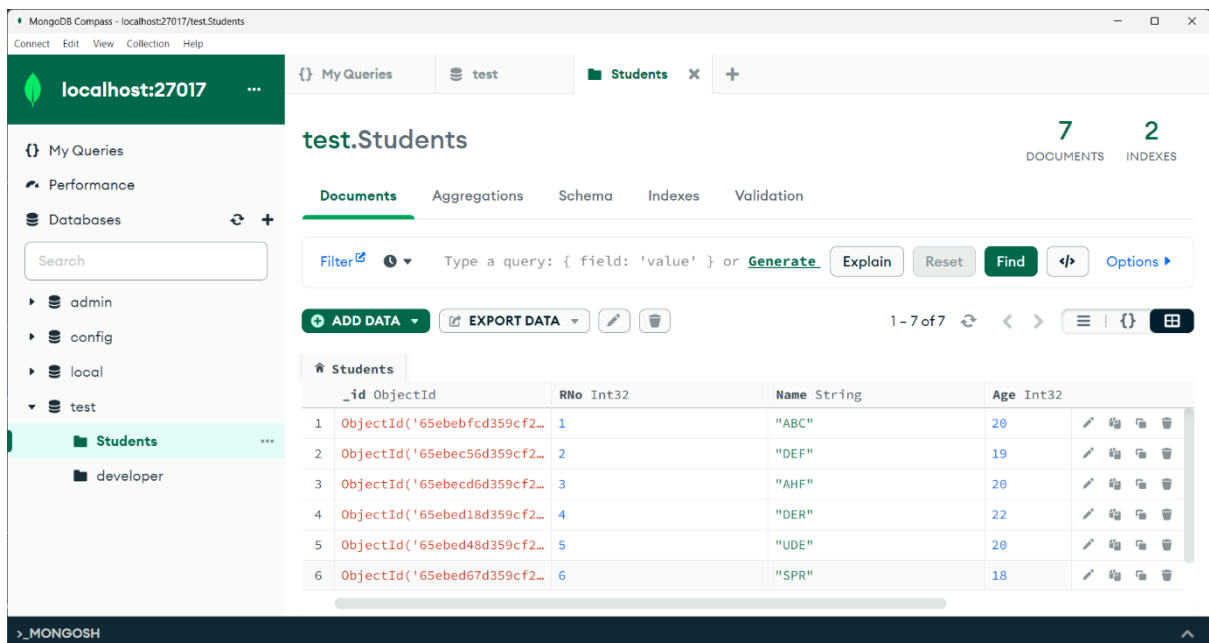

DataBase Creation

1st we created a database named test

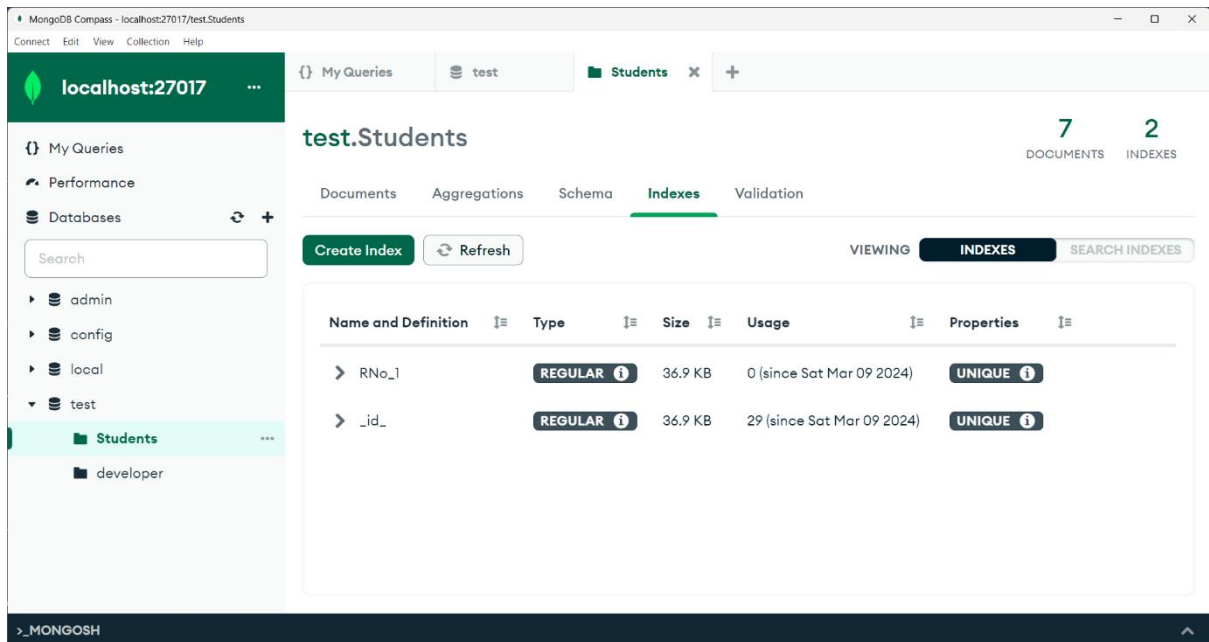

In that test we created a collection named Students

And finally by using ADD DATA , we added data of the students like rno, name, age.

Indexing Creation

As rollno is the unique attribute through which we identify a student uniquely. So, here I created an index based on Rollno. And assigned unique key to it.

Indexing usage

As we gave Rno as unique, If we try to insert a duplicate document that is existed it shows an error like duplicate collection.
